Q: Does the control over what actions my players take make them "roleplay"? When I'm playing roleplay games, I always give a lot of control over the decisions that my players make. Some people prefer a more "narrative" style of play where the players only move the plot along as per their actions, while some prefer the more "sandbox" style where the players have almost unlimited power over the game world (the only restrictions being my "game-world" setting and the fact that I have to place my traps before the players start). The problem is, I've always struggled to find a meaningful way to distinguish between the two, so I'm not sure if my players are just roleplaying or sandboxing. What makes an RPG a roleplaying game in your opinion?

A: In my mind, an RPG is roleplaying if the player's actions directly influence the plot and the environment. If that player is able to cause any significant environmental change, that is sandboxing. If the player's actions can affect the plot in any way, whether it's good or bad for the plot, that is roleplaying. For example, if you play a game where the player can simply walk across the map, explore it, and pick up random objects without any influence on the plot, that's sandboxing. If the player has no real effect on the plot other than choosing the right item at the right time, that's roleplaying. There's no exact line between the two, but I've always felt that it's best to describe an RPG as roleplaying if you can't tell whether a given player's actions are influencing the plot in some way. The number of random items in a sandbox will also be lower, since they'll have less control over the plot.

A: The system of play, not the players actions, makes a game a roleplaying game. In most roleplaying games there is little direct player interaction with the game world or the characters, as players focus more on roleplaying than the actual game world. There are, however, exceptions. Pathfinder is a great example of a roleplaying
