History 2002: Photoshop 1.0 was released. It was a complete rewrite of the program, which Adobe planned to release by the end of that year. However, the Mac version, which was released a month later, was delayed, and the company released it only in early March 2003. While this was significantly less than it had been promised, this release did not include all of the features that Adobe had promised. 2003: Photoshop 3.0 was released. This version increased the level of manipulation that could be done, while also simplifying the program and making it faster. It also included a few minor bug-fixes, and improved workflow support. 2006: Photoshop CS2, the tenth release in the CS series, was released. It introduced content-aware fill and the ability to mask regions of an image. 2007: Photoshop CS3 was released. This version introduced Smart Objects, a feature that allowed anyone to create object-based templates that could be applied to other images. 2012: Adobe announced Photoshop CS5 and added a number of features that it described as "transformational" including Content-Aware Scaling, Smart Sharpen, Film-Convert, the ability to draw on layers (Creative Cloud), and virtual clone stamping. 2015: Adobe announced the release of Photoshop CC 2015. This version addressed a number of bugs and improved file browser integration. Additionally, it introduced a number of 3D features, including the ability to apply 3D space to an image. Features Blend modes Blending layers lets you mix colors from two or more layers, rather than applying them to the image as a whole. For example, you might try a blend of one layer's colors with the other layer's hue, or you can try a blend of a layer with the background, which displays any backgrounds as an opaque color when a blend mode is used. Blend modes include, among others: lighten, darken, multiply, screen, addition, subtraction, hard light, soft light, hue, saturation, color, multiply, screen, difference, and exclusion (this is a mode that combines all foreground colors with the background). Content-Aware Sharpen This feature is intended to produce a sharper image, especially when used in combination with Smart Sharpen. It will alter the sharpness of a photo to adjust the contrast of an image. Content-Aware Fill This feature is intended to compensate for shortcomings in the original
