The news is a medical milestone, but it also opens up the question of what we are going to do to prevent heart disease and the pain and suffering that accompanies it. A major contributor to this decline, particularly among younger people, is that exercise and cardiac rehabilitation are now more accessible than they ever have been. This has been due not only to the booming growth of gym membership, but also to the increasing number of gyms, clubs and fitness centers that are sprouting up around the country. The only problem with this is that many gyms are in areas that are not ideal for active living. I always say to clients, and repeat to my friends, relatives and anyone else who will listen, that the problem with people taking up exercise is often not the lack of time, but their lack of good reason. Most of us know what we should do, but not enough of us do it. The good news is that the medical community seems to be on the right track. The Centers for Disease Control and Prevention is recommending that American adults obtain at least 150 minutes of moderate exercise each week. And we know that regular exercise can decrease your risk of heart disease, stroke, diabetes and obesity, so it's hard to argue against those recommendations. The point is that we need to convince ourselves and one another that exercise is a good thing for our health and our happiness. Take Rolf to work out at the gym. See the dollars his employer will save. Let's face it, we don't think of exercise as a chore that we feel like doing. The problem, however, is that so many people assume exercise is an activity that they feel they should do. Case in point: Rolf. When we first walked into his workplace last month, we made note of how well-dressed and well-groomed he looked. But then we remembered that he is self-employed and that he had to be up for work by 6 a.m. each day.
