Adobe Photoshop Elements was first released in 2002, and is now no longer supported, replaced by new versions of Adobe Photoshop. Adobe Photoshop Elements 8 With Photoshop Elements 8, the most-liked photo editing software available was released on August 3, 2011. The software comes with a limited amount of editing tools. In its earlier versions, image editing was an 'intermediate' skill that took ages to learn for novice users. Now it is not even a beginner tool. Many online tutorials and videos explain the basics of image editing. Adobe Photoshop Elements 9 Adobe Photoshop Elements 10 Adobe Photoshop Elements 11 Adobe Photoshop Elements 12 Feature Comparison Adobe Photoshop vs Adobe Photoshop Elements Adobe Photoshop Elements has full support for 32-bit images. After updating to Adobe Photoshop, you have to convert the images to 16-bit if you want to keep working on 32-bit images. Converting is tedious and can take a long time. Also, creating a 32-bit image from a 16-bit image is very complex, and may consume a lot of memory. Adobe Photoshop Elements supports HDR images, unlike Photoshop. This allows you to adjust the brightness and contrast for a single image. When Adobe Photoshop is updated, its HDR tools become a standard function. Adobe Photoshop Elements 10 has an option to automatically resize images. The real power of Photoshop is its image editing functions. These usually take some time to perform. Adobe Photoshop has a more powerful graphics editor. It allows designers to create professional graphics. It can also help you edit colors, such as brightening or darkening pictures. Photoshop is a more expensive program, while Adobe Photoshop Elements is a less expensive alternative. Adobe Photoshop Elements supports emojis, but it does not allow users to clip the emojis from a message. Photoshop Elements has face-morphing and eye-morphing tools, but they do not seem to function. Photoshop also has a better animation tool. Adobe Photoshop Elements contains advanced tools for retouching and drawing. For example, it is possible to create custom shapes, use layers to combine multiple layers, or make it easier to erase areas, and merge similar images together. You can select a brush type or click and hold to choose a range of color. Or if you are using the Color Picker, as shown below, you can choose a color and paint using it. Or you can paint by using any of the other brushes in the brush palette (the first one is already selected), including the Burn and Blur brushes. Brushes are saved as part of the Brush Palette in Photoshop. I'm working with a client that has a large (a couple thousand pages) website. It's all static files, but I've converted a bunch of them to Jekyll/Liquid/Ruby to more easily make some dynamic elements. Since we've also been using GitHub Pages, it seems like the perfect solution to serve these pages. I was wondering if GitHub Pages can generate pages that are dynamically generated, in a way similar to Jekyll's liquid templates. These would be divs that are updated when certain conditions are met (like in Jekyll pages) but they would be generated with Ruby code, and served out as static content. Any ideas? A: GitHub Pages have a built in templating engine. From the github pages docs: By default, GitHub Pages uses a JavaScript templating language called EJS. you can use a site like adzerk.com to mock up your page and see how it works. for your needs you'd need a web server that's running nodejs. I personally recommend nodejitsu.com // Copyright (c).NET Foundation. All rights reserved. // Licensed under the Apache License, Version 2.0.
