What's new:

Sure, Apple dictating the way developers build applications for iOS might be good for the App Store developers, but it could be the demise of new releases. Apple has stepped on the brakes in developing the Mac experience: in the time that it took for Vista to wend its way across the ocean, to make the switch from Mac OS 9 to OS X, the Mac has been pretty much frozen in time, and as a result, good applications are still about as slow to develop and release on a Mac as Apple's newest OS, iOS. Now, the application of its own ideas to two of the most popular and useful technologies in the Mac world could be the catalyst that leads to Mac-unfriendly applications and the eventual death of Mac OS. It was only last September when I found myself writing about how to get your iPhone ready for the iPhone API 1.0 SDK. But as far as I knew, at the time, there was no initiative on the part of Apple to update Objective-C to take advantage of the new 1.0 APIs and features. Last week, Apple dropped a package of pre-made classes in the iPhone Developer folder, including a code snippet for the latest Objective-C runtime, so that new iPhone applications could be built using the latest language features. I was excited to see that Apple was making classes available, so I fired up XCode and wrote a simple adapter — an instance of NSObject subclass that would wrap NSArray so that an NSArray that was created or manipulated with NSMutableArray's methods would also go through the methods of my object that showed up as an array. I ran the code through the new iPhone SDK version of clang, as well as the latest version of the XCode compiler and it worked perfectly. But I've only been writing Objective-C for about two years now, and I know that there are lots of changes in areas of the language that could confuse people like me that come into the language from the outside. So I thought I'd give the syntax of Objective-C a nice looking over and had it put in to the series of articles I've been planning to write. The hope of this article is that I can show some differences between current Objective-C and updated Objective-C version 1.0 and show that there are changes that can confuse people that aren't properly documented. I've a suspicion that when the version 1.0 information is
