Can anyone help me with a design problem I've been having for the past few days? I have a design for a circuit in my electronics course and I've had a go with the circuit simulator on my drawing program but it doesn't work very well. I'm attaching a zip file including the whole circuit. Here's the manual page from the program: And here's the circuit in my circuit simulator: As you can see, the problem is that on the right hand side of C3 and C4 there's an open loop with a 10k resistor. On the circuit simulator the horizontal lines represent the potentials on each capacitor while the bottom one is the net current into the circuit. On the simulator, the current is all wrong (going back into the +x-axis) which means the impedance is wrong as well as the series resistance of C3 and C4. If anyone can help me, that would be great :) A: There are some details to look at here. The circuit simulator expects the voltage source at the top of the left hand side of the schematic to be 10K, but it is actually a 1K resistor. Make sure that is the same. On top of that, you should use the LEConnector like the manufacturer suggests, so that it tracks the connections in the schematic properly. Building a Future Main menu Post navigation Daylight Savings Time Through January 21st, daylight savings time ends. Consider me in favor of it, even if I'm not sure how I feel about it. I don't know that I like it, but I do understand why it was put into effect. It is here, and it is permanent, so it is worth taking the time to look back at the reasons why it was done. Originally, the idea was to reduce energy consumption by extending the hours of daylight, with the primary goal being to reduce coal heating. Other benefits included longer cold season, reduced office 648931e174
