Electron probe microscopic topography of the superior colliculus in the cat. We have examined the distribution of synaptophysin, choline acetyltransferase and c-fos in the superior colliculus of the cat (subsuperior colliculus and central gray) by use of the immunofluorescence technique and the autoradiographic technique. In the central gray there was almost no background staining after single-labeling with synaptophysin; however, the neurons were clearly stained by double-labeling with synaptophysin and c-fos. In addition, most neurons in the subsuperior colliculus were stained by single- and double-labeling with synaptophysin and choline acetyltransferase. These results indicate that in the central gray there are direct synaptic inputs from the reticular formation, nucleus of the brachium of the inferior colliculus and visual cortex, whereas in the subsuperior colliculus there are moderate inputs from the colliculus, reticular formation, nucleus of the brachium of the inferior colliculus, and visual cortex.

Q: AJAX based content on UIs I am wondering if you can do some basic ajax based content on the UI of a website. A: You can but it's not the way you think. You can call the web api on the back end and populate elements like text boxes based on what you get back from the server. You could also have some javascript code to do the same thing and it's still an ajax call to the server.

Temperature effect on formation of lacunocanalicular complexes and normal keratinocytes. The aim of this study was to observe and evaluate the involvement of the lacunocanalicular complex (LC-DC) in the temperature effect on keratinocyte viability. Keratinocytes were cultured at 37 degrees C, 40 degrees C, 42 degrees C, and 43 degrees C for 24, 48, and 72 hours. Quantitative evaluations of LC-DC complex by electron microscopy indicated a reduction in the number of LC-DCs in keratinocytes exposed to 43 degrees C for 72 hours compared with controls. All temperatures used for 24 hours did not cause significant differences in the number of LC-DCs in the four different experimental times. However, after 48 and 72 hours, significant differences were noted when keratinocytes exposed to 43 degrees C were

Included with every Sennheiser GSP headphone is a convenient neck pouch for safe and secure travel. This pouch will keep your headphones safe during transport and gives you an easy and stylish way to enjoy headphone travel.

Q: How to check if point in polygon is an edge? How do I check if a point is an edge of a polygon? I have an array of points and an array of polygons. As an example, a point is the "points" and polygon is the "array of polygons" I know how to check if a point is inside a polygon. How do I check if a point is an edge of the polygon? I need to determine if the point was the starting point of the polygon, or the ending point of the polygon. I need the function to be fast and accurate

A: Given a point p and polygon poly, you can test whether p is inside poly by using  $p.x > poly.x$  &&  $p.y > poly.y$ , or  $p.x > poly.x$  &&  $p.y > poly.y$ . Given a point p that is on the boundary between two polygons, you can test whether p is an edge by checking whether the closest points from p to the two polygons are the same. This depends on how you're generating your polygons. If you're generating polygons incrementally by adding a single vertex for each connected component of the previous polygon, then you can iterate through the list of polygons and keep track of how many vertices each component has. If you're generating the polygons by unioning two lists of vertices, then this is more complex, but the process is similar. If you need
