Microsoft Excel Excel-based scripts can be created by scripting Excel using a variety of languages (such as VBScript, JScript, and Python) and running the script on the Excel object model. Alternatively, VBA is a language that can be used to automate Excel programs; it can access the native Excel object model or an external COM component, and also allows VBA to automate other Microsoft Office applications, such as Access and Outlook. The VBScript scripting language is a script programming language designed for Excel. Most of its commands have analogs in the native command language of Excel, and the language itself is structured in a similar manner. Thus, scripting with VBScript requires only the familiar programming techniques of working with variables and subroutines, and using the standard Excel object model, but does not require using VBA. Other languages that can be used to access the native Excel object model include MATLAB, and Python. The Python programming language is an

In Excel, regular expressions can be created using the Excel function, RE. The constructors are RE\_NOT, RE\_SOL, RE\_ALL, and RE\_COND. In Excel, regular expressions can be used to validate data using the Excel function, FIND. The constructors are FIND\_NOT, FIND\_SOL, FIND\_ALL, and FIND\_COND. Excel can be written in a more manual way by using VBScript with its 'numbers' object, e.g. Dim xlApp Dim xlBook Dim xlSheet xlApp = CreateObject("Excel.Application") xlBook = xlApp.Workbooks.Open(wbkname) xlSheet = xlBook.Worksheets("Sheet1") xlSheet.Delete() x ca3bfb1094
