Antero Pirata GT: Episodos de Libert.Libert..A history of Orthodontics has been made possible in various ways. For one, modern technology has made it possible to remodel malocclusions and crooked teeth with the help of a few different techniques. Through this history,

it has been seen that tooth shaping has been possible in a number of ways. One of the earliest procedures to shape a tooth involved drilling it out with a drill. By drilling tooth enamel and then filing it into shape, the tooth was able to be shaped by hand. This process was extremely limited, however, and relied almost solely on the dentist's judgment and experience to ensure that the tooth was shaped properly. Moreover, the patient was usually under general anesthesia while the procedure was being performed. This reliance on the dentist's judgment and experience became the focus of a series of developments led by Dr. Kent Bradley in the 1950's. Dr. Bradley developed a number of techniques and machines that used electric motors to shape teeth into more attractive forms. While Dr. Bradley's work was a great advance over the dental work being done at the time, it still was only capable of

being done in one specific area of the mouth. Over the next several decades, Dr. Bradley's techniques would see evolution to the point where even the human hand could no longer shape teeth so accurately. This was in part due to the advancements of robotics in the 1960's and 1970's.

Eventually, it was found that technology could be used to shape teeth in such a way that meant that the patient was no longer under general anesthesia. This discovery, however, led to the process of shaping teeth being further advanced. In the 1990's, the computer became the tool of choice when it came to analyzing and planning the shaping of teeth. With the help of computers, it is possible to analyze numerous different aspects of a patient's dental needs. These tools would allow orthodontists to make a plan for the shaping of teeth by being able to plan every aspect of the procedure from

beginning to end. Furthermore, these tools allowed for a diagnosis to be made that would allow dental treatment to
