Over the past decades, IP has become an increasingly popular communication scheme in wide-area and local-area networks. IP addresses are used to identify hosts and network segments to other hosts and network devices. IP addresses may be assigned to devices for several reasons, including identification of a physical network element, identification of a logical network element, or identification of a logical network element within a physical network element. For example, routers and switches may have a simple network management protocol (SNMP) agent associated with their host that is configured to announce its physical and logical interface addresses to other hosts and network devices. The IP address may be associated with a Uniform Resource Locator (URL) to facilitate the identification of the logical network element and the registration of the logical network element on a network registry or directory. In order to determine the identity of devices or network elements, a network address lookup may be performed. A network address lookup may be performed using an electronic address book. Alternatively, a network address lookup may be performed using a table lookup. A network address lookup table may be a short file that maps the IP addresses to network names, network names to IP addresses, or both. The network address lookup table may be a simple database containing only the mapping of IP addresses to network names. The network address lookup table may be stored on a network device or on a computer server or central repository. IP addresses are created and assigned by a private network and thus possess a structure and organization that is not generally understood by network users. The IP addresses may be very long and complicated, and there may be an ever-increasing number of IP addresses. Mapping IP addresses to network names may be a difficult task for users. It may be difficult to remember a specific IP address. Further, it may be difficult to track the association between network names and IP addresses. For example, a domain name server may contain a large number of IP addresses associated with the IP address 0.0.0.0. The same IP address may be associated with multiple network c6a93da74d
