Last Xp V Iso 2011..Q: SSE - PMOVMSKB *evex-vebx, VSIB/VSIBx and Channel Index Having a bit of a pickle with the SSE registers (and to a lesser extent, through the AVX registers) because of the following operation; PMOVMSKB *evex-vebx On Sse/Sse2 has a vsib (signed multiplication) and vsibx (signed multiplication with index) instruction for VSIB/VSIBx (A Value with Integer Bits) multiplication. PMOVMSKB *evex-vebx (A Value with Integer Bits) has no such instructions. I've been reading some articles on software solutions and have found one that uses a Multiple Of VLDA Vector Length And Scalar Index (MOVMSK Instruction) followed by a PMOVMSKB *evex-vebx. To me however, there are some obvious pitfalls with this approach and want to ask if it is possible to use the VSIB/VSIBx instruction set to do the same operation? Or if this is not the "correct" solution, could you point me in the direction of a working example? Thank you, Mike. A: VSIB for VBV (Vector Bytevev, where each element is a Byte from [0 to 255]) is defined by the Intel® 64 and IA-32 Architectures Software Developer's Manual. It's available in all 4 models of Intel® Core™ processors, but only in 8-bit versions (i.e. VSIBB 8-bit, VSIBW 8-bit, etc...). VSIBB 8-bit is used with VSIBB 8-bit, VSIBW 8-bit and VSIBD 8-bit in SSE instructions. I don't think there are any 64-bit processor that implement VSIBB 8-bit because it's only used for 8-bit values.
