This trend is reflected at the application level in the fact that Stampede2 delivers better performance for particular classes of applications, with especially dramatic benefits to compute-intensive applications. For example, task-level performance analysis will show that these applications will get better performance with Stampede2 than with any other existing and upcoming Nagios Core , with large improvements in workloads that are considered particularly compute-intensive. Increasingly, Stampede2 is being evaluated as a platform for benchmarking new and candidate workloads. Until now, however, Stampede2 has largely been available only to NASA scientists and engineers, both at NASA Ames and elsewhere. Stampede2 is now available to researchers at public and private universities and companies throughout the world. I would like to be able to manage multiple engines, which are clusters of nodes and an automatic load balancer that is always online. Nagios Core is capable of sending data to another Nagios Core instance with the --exchange add-on. A

service is a particular type of monitoring and management operation.

Most Nagios Core services do not check things that are common to all hosts, such as connectivity to the Internet. Instead, they check for more host-specific conditions, such as the status of a daemon. These host-specific conditions are called conditions. i am trying to create on cluster in which i am trying to send multiple configuration file. i have installed four Redhat OS in VMWARE which is connected through IP. when i run script at host server with ssh-keygen, it always ask me for password. To resolved it i have also used sshpass and passing password from one temp file but same issue. each time it ask for password. i have follow all three steps of SSH-KEYGEN. Could you please help me, where could be a mistake.
