Adobe offered the "hello world" for any newbies who want to get their feet wet with this new product. With a familiar interface and a robust set of tools at your disposal, there's no reason that you can't get going in Photoshop in 10 minutes, and doing so with a welcoming community of peers that are ready to provide answers should your question arise. A new Feature called "All-new Shape Manager" might be worth mentioning. I have not experimented with it as yet, but it will be interesting to see how interesting it is. The new Shape Manager allows you to quickly change the Shape in a layer as needed. Without changing the original image, you can just change the size, position, and opacity of that Shape. The ShapeManager is similar to the Pressure Adjust in Photoshop. It allows you to control a layer in terms of how it reacts to other layers and other objects on the active layer. The feature also allows you to change settings in each layer to adjust transparency or change which layer it is applied to, similar to the Layer Styles. Overall, it's a valuable addition and I could see it being used frequently by some photographers. This layer control feature will not replace Layer Styles, but might be a good alternative for some users who prefer that over the one found in Photoshop. The most controversial feature of Photoshop 2023 is its new Lens Blur effect. As you'll likely see, I see a problem with its implementation. The stated goal of lens blur is to blur—that is, soften—an image on the basis of its distance from the photographer. When you move close to a subject, you want to see what you're reaching for in focus; when you move back, you want to see the blur. A digital camera, which records a blurry image at all times, provides a natural and probably more practical method of creating this effect. Photoshop 2023's Lens Blur inverts this logic by causing the currently selected object to become more blurry (as it moves away) than the background becomes sharper (as it gets closer). This is called an "ambient blur."
