Substitution of the expressions for f and h into eq.(3) gives the desired result for the case $h=0$, $\tau_0 \rightarrow 0$. The equation for f_{qp} is still valid in this limit. The asymptotic result eq.(15) is applicable to large, but finite times. At small times, the function $g_0(t)$ still oscillates with the same frequency as at large times, but their amplitudes are strongly renormalized. It is also easy to see that the inelastic co-tunneling at small times is suppressed with respect to elastic tunneling (or to coherent tunneling) by a factor of the order of the ratio of the tunneling rates $\Gamma_0/\gamma_0^{\prime}$, which can be derived using eq.(3), and n_0 is the initial quasiparticle density. Note that the derivation of the density matrix relies on the fact that the tunneling Hamiltonian preserves energy and momentum. If the tunneling interaction is weak ($\Gamma_0, \gamma_0^{\prime}$)
