Some of the new Phoronix Test Suite options (included or not) A: I recommend trying out a couple of the many test suites that are available. I like at least two that are available: system-checkers: a collection of tests to analyze your PC hardware for compatibility problems, like: memory, motherboard, HD, CPU and GPU. phoronix test suite: a collection of tests for comparing PC hardware. The most important tool (for me) is phoronix test suite - it has nearly 650 tests of various hardware, such as GPU, video, PCI/PCIe devices, USB devices, audio, network and more. It's all designed to work with linux. Here's an example. In the past, I ran across this way of installing a test suite. sudo apt-get install phoronix-test-suite Or, alternatively, you can install it from the phoronix-test-suite repository (that's what I did): sudo add-apt-repository ppa:happyaron/ppa sudo apt-get update sudo apt-get install phoronix-test-suite Then to run a test: sudo phoronix-test-suite benchmark A: phoronix test suite is a great tool for testing various components of your PC. You can find them in the main page of the suite, with every functionality as a command. From the home page, you can run different test categories. After the test, you can get benchmark information in a simple table. Example: Run benchmark (manually) or Press Q Information is displayed in a table, with results for different systems.
