After several weeks of use, I upgraded my CC subscription to CS6 Pro from CS6 Community. So far I like the ability to create and edit my own templates (and even modify a few of Adobe's built-in ones) that would have required customization when Creative Cloud was available. The ability to edit my own work but share it via Creative Cloud is a nice benefit. Who knows, this may become a CC style subscription. Overall it has been a worthwhile upgrade for me and my bottom line.

Adobe Photoshop CS6 is, undoubtedly, the best image editing application to date. Not only that, it is the best affordable, and most feature-rich, one that I've seen. I appreciate the comprehensive and very well-thought out series of tutorials for the new additions in this version. I also really like that one can create unique presets for features like crop, enhance and contrast which you can then apply to the image or even save as your own custom preset. This makes for a very smart and robust software feature, truly unique.

Photoshop is evolving. It is changing. But this should be encouraging: it's not going anywhere. In fact, Photoshop is the only product that I can think of that I would place in the category of software that will never die. It's just what software is (and should be). It will change and adapt. The only thing that won't change is people's need and desire for new graphics and new technology. That's what keeps me coming back for my work.

When Adobe made CS6 I was thrilled to see the changes they made to the UI. I thought that those changes were really necessary - they definitely did improve the user experience. However, as I continue to use the software, I have found it to not so much be an upgrade from Personal Edition as it is a true protoplasmic rejuvenation of the product. My one challenge with Photoshop is that it still has the occasional hiccup at strange times, but my hunch is that developers are working on patches, if not already finalizing them, to address the issues. As it is now, it's no marvel of a program, but it's user friendly and the "learning curve" is not steep. Adobe has done an outstanding job of opening up the app to new users and newcomers to the world of photos.

Photoshop will now use intelligent AI to identify, tag and organize photos in your computer in real time. How? Adobe Sensei, the intelligent engine powering Photoshop CC. It automatically tags your photos with a couple of seconds of work and now does it in real time. Now when you walk into a photo of a friend with a question—“Hey, what is she wearing?”—you can ask the AI engine there and then and get an instant, accurate answer. Interaction with the system is easy and efficient.

And if you're still not sure what tags you want, telling the AI what you like will quickly inspire the system to respond. Of course, you can also ask it to tag photos for you. All the relevant tags will be right there in the tags panel, so you can pick the most salient tags and work with them. For designers and photographers who want a different kind of tool than Photoshop, my book, *The Painless Guide to F-The Eye of the Storm: Designing and Building an Interactive Studio*, is a great choice. The most dramatic change in Photoshop's latest major update is the inclusion of GPU-based compositing. While this computation is most powerful and versatile for Photoshop CC's raw rendering feature, it also works with existing film, video, and photo effects. For more about this important feature, check out the tutorial below. Traditional compositing in Photoshop requires a CPU to compute the content of a layer. Depending on the complexity of an effect, this can result in slow performance. This performance hit is even greater if CPU and memory are shared by other processes. Photoshop's new GPU-based compositing feature allows for the creation of more sophisticated and realistic graphic simulations. The availability of the GPU hardware - which is responsible for the monitor refresh - makes this possible. To set up a graphic simulation, edit a photo or film, assign a layer with a blue or green blend type, and click inside the layer's content with the Alt/Opt key pressed. Alternatively, you can select a layer or group of layers within the Layers palette, and then use Edit > Distort > Blend to create a GPU-based compositing effect. The palette window becomes Fade to complete the process. In addition to Photoshop, Adobe also announced a new AI-powered Photoshop Sensei free-form photo editor, which is similar to the ordinary image editing capabilities provided by Capture for Colab. This new collaboration app is powered by Adobe Sensei AI, the same technology used in the flagship products of the Adobe family of products, such as Photoshop, Lightroom, InDesign and Adobe Digital Publishing Suite. Adobe Sensei AI is smarter than any other image understanding and editing technology because it can take consumer photos such as those from Instagram or imported from a smartphone and detect all the data in them, such as someone's hair color, facial expressions, landmarks, buildings, and more - and actually understand the things in the photo, making it easier to put together sophisticated images, and provide editing functions such as Editable Quotes to create output.
