In the current web landscape, designers and developers alike are forced to make trade-offs between performance and usability when building their web sites. For example, it's easy to create a brilliant brochure-style web page that looks great on desktop and mobile devices, but it's frustrating on a smartphone, because it's very slow and hard to interact with. Conversely, it's easy to optimize for speed and accessibility but hard to create the nuanced design aesthetic that makes a gorgeous print piece come to life. Read more... on Pixability

Don't like it? We don't either. We're moving fast and fluid when it comes to improving our products, designing new features, experiments and beta programs. However, we know that our users want to get the most out of Photoshop, and we want to make it easier for them to get exactly that. That's why we're doubling down on mobile accessibility with Photoshop Camera and expanding our Photoshop primary web platform.

The current Photoshop user interface is great for desktop and laptop computers, but it's not very good for mobile. It's very cumbersome to zoom and navigate, not only for people with smaller screens, but also for mobile touch users with smaller touch screens and haptic feedback.

Among today's web developers, there's a growing thirst for serverless technology. Developers choose serverless to build robust, design-focused applications in which they configure and manage infrastructure, not code. Serverless connections to the data layer means solutions scale instantly and easily, without additional effort. Resilient scaling should also allow for lower levels of operations overhead, secure more easily, and provide better error-handling and system resilience.
