I have found this blog post from Adobe about the update. I ran Photoshop CC on a 2017 Mac Pro and I found that performance was significantly slower than the fill rates for both the DNG and the DNG Fill. The performance was even worse with ACR.

This is a major reason for replacing Photoshop. It's not weird for a nearly $1,500 app to have some quirks introduced into the update noticeable enough to make the app harder to use. After all, that's what $1,500 worth of extra horsepower is supposed to do for you. But in this case, Photoshop left the Mac Pro with roughly the same performance it had left the first Mac Pro in 2012– which is to say, really, really slow. A good thing to do is to try to get as close to the maximum limit of pixels that fit in the picture plane. If this is over 6,400 by 2,800 pixels, I usually use a file with 8,000 pixels on each side. As I suspected, increasing the size of the downsample layer noticeably improved photo-editing speed, particularly in the final image export. The downsample layer lets you use the Pixel Cache feature to "stamp" the processor with a pixelated image instead of the mostly-pixelized result that occurs when you decrease the image size and subsequently throw out the extra pixels. The first step should be to make sure that the image preview hasn't been clipped to the canvas by running a quick "merge visible." Then you'll need to use the information in the Histogram panel (the main window) to choose the lightest area of the image, and the Smart Brush to Select areas with similar tonal values. Then you'll select objects with a brush and Command-d. Later, when you have interesting selections to apply, you'll generally do it on the same layer as the selection you created.

What It Does: Layers act as an organizational layer. A Photoshop document is an overall piece of

work focused around a set of layers. One can substitute the term 'layer' to describe any factor of the original image that affects the finished product in some way, such as: background, foreground, text, hard light, soft light, shadow, key light, and so on. This is a very handy technique for creating multiple photo sets for titles, credits, etc. It's also great for creating color guides, guides, and layers for retro or grunge effects, mood boards, social media graphics, etc. **What It Does:** A preview panel normally displays in the lower left hand corner of the screen, above the toolbars of your selected tool. The preview window is a helpful tool to know how your selections and edits will appear. What it will look like on your finished product. In fact, it's extremely helpful for working with layers, masking, basic retouching, and even color (see below for some neat tips on using the preview window). The panel contains three key functions: the layer "view" (click on the layer thumbnail to open the panel), the mask "view" (click on the mask thumbnail to open, and then click on the mask thumbnail again to close it), and the type tool (use a key to activate it). The layer and mask previews are easily viewed by clicking on the icon for each in the preview panel. **What It Does:** The Gradient Fill tool allows you to fill an area with one tone of a specified color. For instance, if you want a square area on your image with a brownish tan color, you would fill it with the color brown. The Gradient Fill tool allows you to change your color. Imagine if every time you want to take a picture with a family of people, you have to have crew members constantly hold the camera down to their right side and take a picture there. The Gradient Fill tool allows you to cover their left side and take the picture instead. e3d0a04c9c
